Module 3 - Part 3.2 - API Gateway + Lambda

Key Points

- We will create another separate Lambda function that will host the logic to retrieve evaluation results from DynamoDB.
- Our Lambda function will need to extract the arguments from the caller before it can call the GetItem request in DynamoDB.
- Using a dedicated Lambda function allows you to separate concerns and adhere to the Single Responsibility Principle (SRP). Having separate functions also allows you to independently scale and monitor your functions based on their workload.
