AWS Learning Accelerator
Module 1 - Part 1.1 - S3 + Lambda

Key Points

- We will use a feature of S3 called Triggers. Triggers allow you to notify other AWS services when a file gets created, modified, or deleted. We are interested in using the PUT notification type which corresponds to fiel uploads.
- When S3 triggers your Lambda function, it will provide the S3 bucket and file details of the file being uploaded in the **event** arguments. We will use this information later to interact with Amazon Rekognition.
